

Town of Randolph – Conservation Commission

Double Hay Bale Erosion Control Policy:

The Randolph Conservation Commission will no longer allow silt fence as an erosion control measure.

Effective immediately for all new projects, a standard erosion control detail is the double hay bale detail (see below). Any deviation from the standard double hay bale detail will require a waiver from the Randolph Conservation Commission.

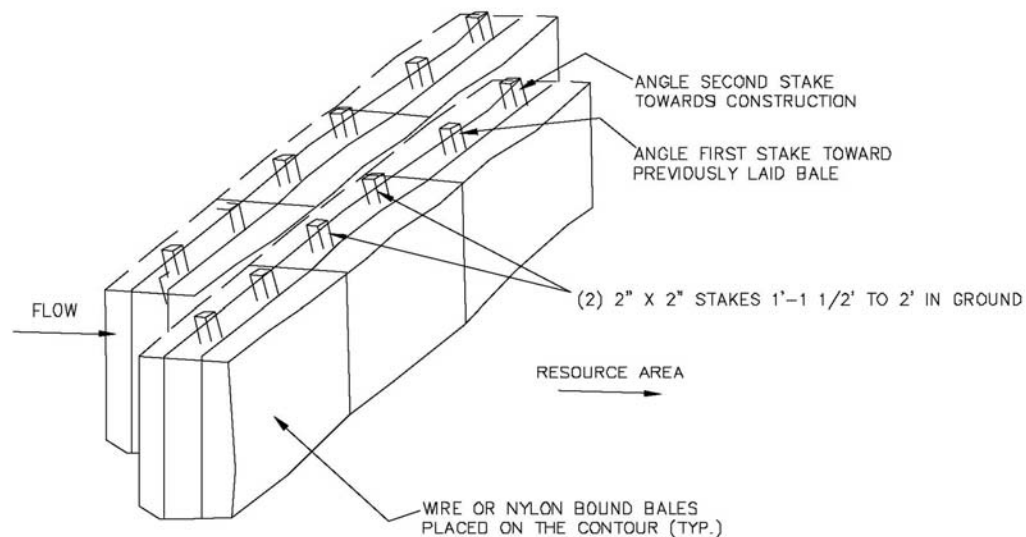

If ordered by the Commission or its Agent, to replace an old erosion control line a double hay bale line will be installed in accordance with this policy unless specified otherwise at a Randolph Conservation Commission public meeting.

The Randolph Conservation Commission reserves the right to require a different erosion control standard for wildlife crossings per any conditions from NHESP or for water crossings.

Hay wattles, weed-free wattles, rice wattles, or straw bales are a preferred alternative to hay bales. Should the applicant and its designees wish to substitute any of the above mentioned products in place of hay bales on site, the Randolph Conservation Commission must be notified in advance of installation.

In addition, hay bales or alternative erosion control products utilized must be certified to be weed free to prevent the spread of invasive species.
